

Lab - Troubleshoot Control Plane Policing (CoPP) (Instructor Version)

Instructor Note: Red font color or gray highlights indicate text that appears in the instructor copy only.

Answers: [22.1.4 Lab - Troubleshoot CoPP](#)

Topology

Addressing Table

Device	Interface	IP Address	Subnet Mask
R1	G0/0/0	172.16.12.1	255.255.255.252
	G0/0/1	10.10.1.1	255.255.255.0
R2	G0/0/0	172.16.12.2	255.255.255.252
A1	VLAN 1	10.10.1.4	255.255.255.0
PC1	NIC	10.10.1.5	255.255.255.0

Objectives

Troubleshoot network issues related to the configuration and operation of Control Plane Policing (CoPP).

Background / Scenario

Control Plane Policing (CoPP) is a protection feature for the router's control plane CPU. CoPP can granularly permit, drop, or rate-limit traffic to or from the CPU using a Modular QoS CLI (MQC) policy. The CoPP policy is applied to a dedicated control-plane "interface" which protects the CPU from unexpected extreme rates of traffic that could impact the stability of the router.

Lab - Troubleshoot Control Plane Policing (CoPP)

Note: The routers used with CCNP hands-on labs are Cisco 4221 with Cisco IOS XE Release 16.9.4 (universalk9 image). The switch used in the lab is a Cisco Catalyst 2960 with Cisco IOS Release 15.2(2) (lanbasek9 image). Other routers, switches, and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and the output produced might vary from what is shown in the labs. Refer to the Router Interface Summary Table at the end of the lab for the correct interface identifiers.

Note: Make sure that the routers and switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Instructor Note: Refer to the Instructor Lab Manual for the procedures to initialize and reload devices.

Required Resources

- 2 Routers (Cisco 4221 with Cisco IOS XE Release 16.9.4 universal image or comparable)
- 1 Switch ((Cisco 2960 with Cisco IOS Release 15.2(2) lanbasek9 image or comparable)
- 1 PC (Choice of operating system with a terminal emulation program and a packet capture utility installed)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet cables as shown in the topology

Instructions

Part 1: Trouble Ticket 22.1.4.1

Scenario:

At the main office, a decision was made to eliminate the use of Telnet for network device management. Rather than place ACLs on each interface, the main office network technician edited the existing CoPP configurations on the branch router R1, adding the restriction on Telnet by creating an ACL, class-map, and policy-map to drop all Telnet traffic to the router. The tech also added a traffic class for SSH access. While testing the new changes at the branch office, the branch network technician finds that Telnet is still possible.

Your tasks are to FIND the error(s), document your findings and the command(s) or method(s) used to fix them, FIX the issue(s) presented here and then test the network to ensure the following conditions are met:

- 1) the complaint received in the ticket is resolved
- 2) the control-plane policy-map keeps Telnet from succeeding either from the main office or from the branch management network.

Use the commands listed below to load the configuration files for this trouble ticket:

Instructor Note: Commands for uploading the configuration are provided at the end of this document.

Device	Command
R1	<code>copy flash:/enarsi/22.1.4.1-r1-config.txt run</code>
R2	<code>copy flash:/enarsi/22.1.4.1-r2-config.txt run</code>
A1	<code>copy flash:/enarsi/22.1.4.1-a1-config.txt run</code>

- PC1 is on the management network and is configured with a static IP address from the addressing table.
- **aaa new-model** is enabled on router R1.
- Privileged EXEC password is **cisco12345cisco**.
- Passwords on all devices are **cisco1234**. If a username is required, use **admin**.
- After you have fixed the ticket, change the MOTD on EACH DEVICE using the following command:

banner motd # This is \$(hostname) FIXED from ticket <ticket number> #

- Save the configuration by issuing the **wri** command (on each device).
- Inform your instructor that you are ready for the next ticket.
- After the instructor approves your solution for this ticket, issue the privileged EXEC command **reset.now**. This script will clear your configurations and reload the devices.

Instructor Notes:

CoPP configuration errors are difficult to see sometimes in a small network with virtually no traffic. Remind the students that they may not be able to recreate the identical symptoms. They should examine the configuration and operation of the devices carefully to find the issues.

This trouble ticket contains an intentional error.

The policy map is out of order. The class map CM-MGMT comes before the class map CM-TELNET in the policy map configuration. Class map CM-MGMT uses the MGMT ACL, which contains a **permit tcp 10.1.1.0 0.0.0.255 any** statement. That statement allows Telnet from the branch management network to succeed, whereas it fails from the main office network.

To fix problem: It is necessary to delete and recreate the policy map PM-COPP to reorder the statements to put the class CM-TELNET ahead of the class CM-MGMT. (suggest students use Notepad to cut and paste the changes) The commands to do this are:

```
R1(config)# control-plane
R1(config-cp)# no service-policy input PM-COPP
R1(config-cp)# exit
R1(config)# no policy-map PM-COPP
R1(config)# policy-map PM-COPP
R1(config-pmap)# class CM-SSH
R1(config-pmap-c)# police 50000 conform-action transmit exceed-action transmit
R1(config-pmap-c-police)# class CM-EIGRP
R1(config-pmap-c)# police rate 10 pps conform-action transmit exceed-action transmit
R1(config-pmap-c-police)# class CM-TELNET
R1(config-pmap-c)# police 8000 conform-action drop exceed-action drop
R1(config-pmap-c-police)# class CM-MGMT
R1(config-pmap-c)# police 8000 conform-action transmit exceed-action transmit
R1(config-pmap-c-police)# class CM-ICMP
R1(config-pmap-c)# police rate 10 pps conform-action transmit exceed-action drop
R1(config-pmap-c-police)# class class-default
R1(config-pmap-c)# police 12000 conform-action transmit exceed-action transmit
R1(config-pmap-c-police)# exit
R1(config-pmap-c)# exit
R1(config-pmap)# exit
R1(config)# control-plane
R1(config-cp)# service-policy input PM-COPP
R1(config-cp)# end
```

Note: Students may choose edit the MGMT ACL to remove the permit statement that is allowing the Telnet from the management network. Because that statement may be allowing other management traffic, it should not be removed.

Part 2: Trouble Ticket 22.1.4.2

Scenario:

Lab - Troubleshoot Control Plane Policing (CoPP)

While the main office network tech was editing the CoPP configuration on the branch R1 router, the tech noticed that there was not a separate class for SSH, that it was part of the MGMT class. The tech decided to add a traffic class for SSH access, so it would be easier to troubleshoot remote access issues. The branch technician reports that after the traffic class change was added, SSH seems much slower and less responsive than before.

Your tasks are to FIND the error(s), document your findings and the command(s) or method(s) used to fix them, FIX the issue(s) presented here and then test the network to ensure the following conditions are met:

- 1) the complaint received in the ticket is resolved
- 2) SSH traffic response issues are solved

Use the commands listed below to load the configuration files for this trouble ticket:

Instructor Note: Commands for uploading the configuration are provided at the end of this document.

Device	Command
R1	<code>copy flash:/enarsi/22.1.4.2-r1-config.txt run</code>
R2	<code>copy flash:/enarsi/22.1.4.2-r2-config.txt run</code>
A1	<code>copy flash:/enarsi/22.1.4.2-a1-config.txt run</code>

- PC1 is on the management network and is configured with a static IP address from the addressing table.
- **aaa new-model** is enabled on router R1.
- Privileged EXEC password is **cisco12345cisco**.
- Passwords on all devices are **cisco1234**. If a username is required, use **admin**.
- After you have fixed the ticket, change the MOTD on EACH DEVICE using the following command:
banner motd # This is \$(hostname) FIXED from ticket <ticket number> #
- Save the configuration by issuing the **wri** command (on each device).
- Inform your instructor that you are finished.
- After the instructor approves your solution for this ticket, issue the privileged EXEC command **reset.now**. This script will clear your configurations and reload the devices.

Instructor Notes:

CoPP configuration errors are difficult to see sometimes in a small network with virtually no traffic. Remind the students that they may not be able to recreate the identical symptoms. They should examine the configuration and operation of the devices carefully to find the issues.

This trouble ticket contains an intentional error.

The class CM-SSH is given the same policing action as the class CM-ICMP instead of the same actions as the CM-MGMT, which is the desired result.

To fix the problem: Correct the policing for SSH traffic, make it the same as the CM-MGMT class. It is not necessary to delete and recreate the policy map PM-COPP, only to remove it from the control-plane until it is edited. Commands to do this are:

```
R1(config)# control-plane
R1(config-cp)# no service-policy input PM-COPP
R1(config-cp)# exit
R1(config)# policy-map PM-COPP
R1(config-pmap)# class CM-SSH
```

Lab - Troubleshoot Control Plane Policing (CoPP)

```
R1(config-pmap-c)# police 8000 conform-action transmit exceed-action transmit
R1(config-pmap-c-police)# exit
R1(config-pmap-c)# exit
R1(config-pmap)# exit
R1(config)# control-plane
R1(config-cp)# service-policy input PM-COPP
R1(config-cp)# end
```

Router Interface Summary Table

Router Model	Ethernet Interface #1	Ethernet Interface #2	Serial Interface #1	Serial Interface #2
1800	Fast Ethernet 0/0 (F0/0)	Fast Ethernet 0/1 (F0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)
1900	Gigabit Ethernet 0/0 (G0/0)	Gigabit Ethernet 0/1 (G0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)
2801	Fast Ethernet 0/0 (F0/0)	Fast Ethernet 0/1 (F0/1)	Serial 0/1/0 (S0/1/0)	Serial 0/1/1 (S0/1/1)
2811	Fast Ethernet 0/0 (F0/0)	Fast Ethernet 0/1 (F0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)
2900	Gigabit Ethernet 0/0 (G0/0)	Gigabit Ethernet 0/1 (G0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)
4221	Gigabit Ethernet 0/0/0 (G0/0/0)	Gigabit Ethernet 0/0/1 (G0/0/1)	Serial 0/1/0 (S0/1/0)	Serial 0/1/1 (S0/1/1)
4300	Gigabit Ethernet 0/0/0 (G0/0/0)	Gigabit Ethernet 0/0/1 (G0/0/1)	Serial 0/1/0 (S0/1/0)	Serial 0/1/1 (S0/1/1)

Note: To find out how the router is configured, look at the interfaces to identify the type of router and how many interfaces the router has. There is no way to effectively list all the combinations of configurations for each router class. This table includes identifiers for the possible combinations of Ethernet and Serial interfaces in the device. The table does not include any other type of interface, even though a specific router may contain one. An example of this might be an ISDN BRI interface. The string in parenthesis is the legal abbreviation that can be used in Cisco IOS commands to represent the interface.

Uploading Configuration Files

Use the commands below to create the configuration files on the lab devices for each trouble ticket in this lab. The TCL script commands help create and copy the configurations. However, the configuration commands could also be copied and pasted directly into global config mode on each device. Simply remove the TCL script commands, enter the **enable** and **configure t** commands on the device, and copy and paste the configuration commands.

Important: The device requires a folder in flash named **enarsi**. Use the **dir** command to verify. If the folder is missing, then create it using the **mkdir flash:/enarsi** privileged EXEC command. For all switches, make sure the **vlan.dat** file is set to the default. Use the **delete vlan.dat** privileged EXEC command, if necessary.

Reset scripts

These TCL scripts will completely clear and reload the device in preparation for the next ticket. Copy and paste the appropriate script to the appropriate device.

R1/R2 Router Reset Script

```
tclsh
puts [ open "flash:/enarsi/reset.tcl" w+ ] {
typeahead "\n"
copy running-config startup-config
typeahead "\n"
erase startup-config
puts "Reloading the router"
typeahead "\n"
reload
}
tclquit
```

A1 (Cisco 2960 Script) - The default 2960 SDM template does not support IPv6, so this script includes that setting.

```
tclsh
puts [ open "flash:/enarsi/reset.tcl" w+ ] {
typeahead "\n"
copy running-config startup-config
typeahead "\n"
erase startup-config
delete /force vlan.dat
delete /force multiple-fs
ios_config "sdm prefer lanbase-routing"
typeahead "\n"
puts "Reloading the switch"
typeahead "\n"
reload
}
tclquit
```
